

What Plants Need to Grow & Their Parts

PLANTS

BASIC SCIENCE | WEEK 2 | CLASS: BASIC 3

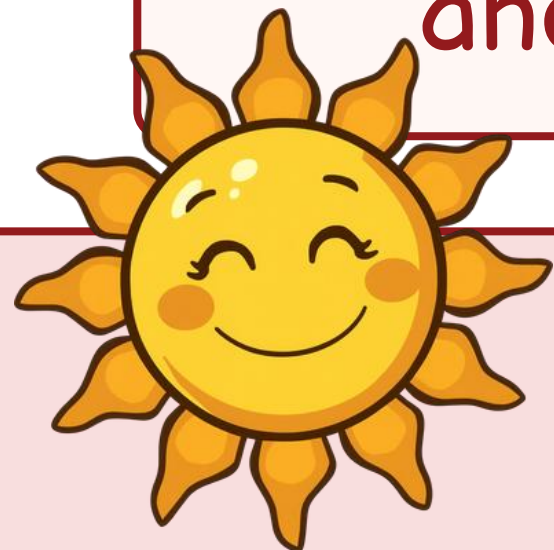

BY THE END OF THE LESSON, I CAN :

1

Describe the things a plant needs to grow and survive.

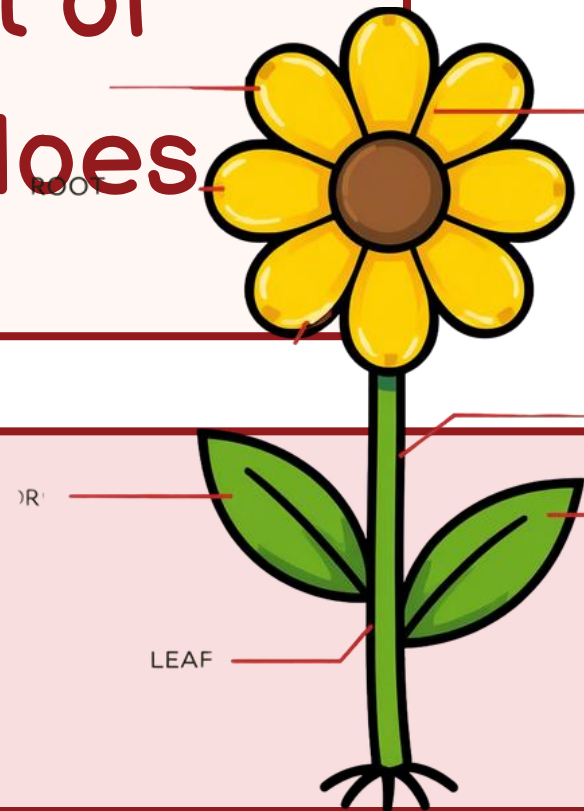

2

Identify the main parts of a plant (root, stem, leaf, flower).

3

Explain what each part of the plant does.

Let's Remember 🌱

A plant is a living thing. It grows, just like animals and people.

Look at these two plants — why do they look different?

WHAT PLANTS NEED

A plant needs 5 things to grow:

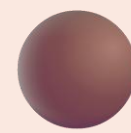

Sunlight

Water

Air

Soil

Space

Energy & Life!

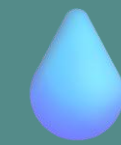

Sunlight

 **Sunlight** — the plant uses sunlight to make its own food. Without sunlight, a plant cannot make food and will grow weak.

Essential!

Water

Water helps the plant grow and carries food to all parts of the plant. Without water, a plant will dry up and die. 

Fresh Air!

Air

 **Air — the plant needs air to live, just like we do. Without air, the plant cannot breathe and will not survive!**

Nourishment!

● Soil

● Soil — soil holds the plant firmly in the ground and gives it food (nutrients). Without soil, the plant cannot stand firm or get food.

Plants Need Space

Space

 **Space** – a plant needs enough room to grow bigger. Without space, the plant cannot grow well. When plants have plenty of space, their roots spread out and their leaves reach for the sun!

PARTS OF A PLANT

A PLANT HAS 4 MAIN PARTS: 🌱 ROOT 🌿 STEM 🍃 LEAF 🌸 FLOWER

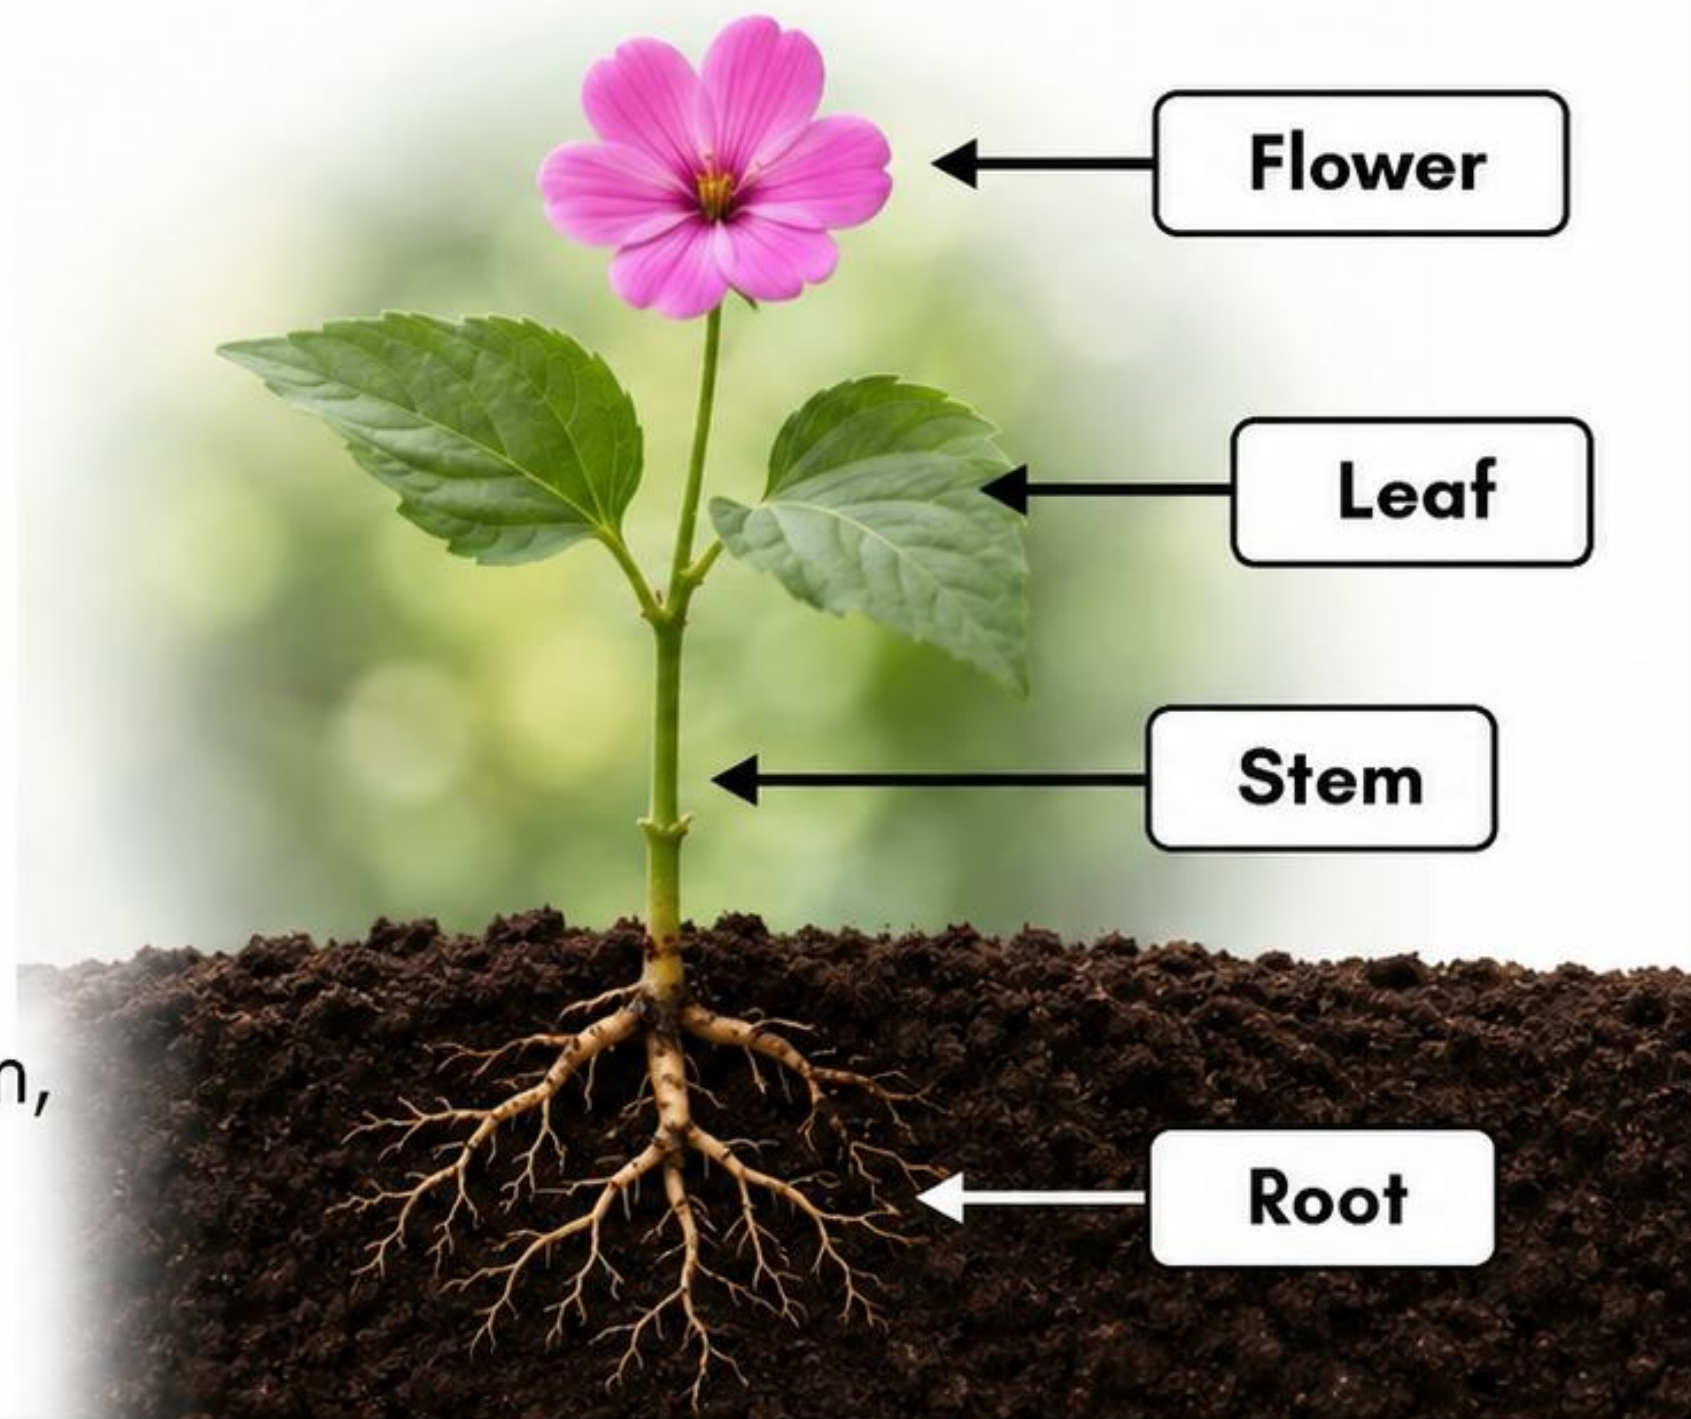

OVERVIEW

Parts of a Plant

A plant has 4 main parts that work together to help it grow, survive, and make new plants.

4 Main Parts

A plant has 4 main parts: 🌱 Root, 🌿 Stem, 🍃 Leaf, 🌸 Flower. Each part has its own special job!

ROOT

What does the root do?

Root – holds the plant firmly in the soil and takes in water and nutrients from the soil.

Where are the roots?

Roots grow underground. They spread out in the soil to keep the plant stable and to soak up water and nutrients the plant needs to grow.

STEM

Support

 The stem holds the plant upright and keeps it standing strong in the soil.

Transport

 The stem carries water and nutrients from the root to the leaves and flowers of the plant.

LEAF

Function

The leaf uses sunlight, air and water to make food for the plant. This process is called photosynthesis.

Did You Know?

Leaves are green because of a special substance called chlorophyll. Chlorophyll captures sunlight and helps turn air and water into food energy for the plant.

FLOWER

Flower

The flower makes seeds so that new plants can grow. It is often bright and colorful to attract bees and butterflies.

What does it do?

When a bee visits a flower, it helps carry pollen from one flower to another. This helps the flower make seeds that grow into new plants!

SUMMARY

What I Learned 🌱

Plants are living things! They need sunlight, water, air, soil and space to grow.

Plant Parts & Their Jobs 🌿

A plant has 4 main parts — 🌱 Root, 🌿 Stem, 🍃 Leaf, 🌸 Flower — and each part has its own special job!

EVALUATION

What part of the plant holds it in the soil? 🌱

Which part carries water and nutrients to other parts? 🌿

Where does the plant make its food? 🍃

What part helps the plant make seeds? 🌸

Mention 5 things plant needs to survive

Thank you for Learning!
